About this catalogue

Dr. Ehrenstorfer is the leading manufacturer of pesticide standards and other organic reference materials. Over 8,000 different products are typically available from stock, ensuring we will respond rapidly to your reference material needs. Materials are available in a number of formats including neat / powder materials, solutions of individual compounds and mixtures of compounds. Please see the **Interpreting product codes and part numbers** section for how the product code can help you identify what format the product is supplied in.

For ease of use we have collated **Key product categories**. This listing includes all relevant individual products and mixtures. As pesticides comprise the largest proportion of the catalogue they have not been categorised separately and can be located in the **Alphabetical listing of individual standards** section.

All individual neat and solution Dr. Ehrenstorfer products are listed alphabetically in the **Alphabetical listing of individual standards** section in the middle of this catalogue. This index details all available pesticide and pesticide metabolite standards. The structure, molecular formula, molecular weight and CAS number (where available) are given in this section.

Our range of **Aqueous inorganic standards** from VHG can be found listed towards the end of this catalogue. These have been included for the convenience of many of our customers who undertake both of organic and inorganic analysis.

We have included an index of **Pesticides metabolites** that are available from Dr. Ehrenstorfer. This lists pesticides alphabetically, together with their corresponding metabolites and their unique eight digit identification code. For full details of the range of available products for each metabolite, please refer to the **Alphabetical listing**.

These individual listings allow for alternative methods of locating the material that you require. Our catalogue of reference materials is continuously growing, therefore if you have any difficulty finding a product, please contact your local sales office, email us at askus@lgcstandards.com or log onto our webshop www.lgcstandards.com, where the most up to date listing of all our product ranges and catalogues can be found.

Interpreting product codes and part numbers

The Dr. Ehrenstorfer range covers more than 5,000 individual substances in more than 8,500 individual products. The reference standards are presented in a number of formats including:

- neat materials
- solutions of individual compounds
- mixtures of compounds

All products in the catalogue are pre-fixed with the code DRE-. This is then followed by a letter code to indicate the format and certification of the product, an 8 digit unique identification number and a letter code to indicate the solvent used for solution products.

Please refer to the letter codes below for a description of the certification level, format and packaging in which the product is supplied.

Example product code: DRE-XA10230000CY

Quality and accreditation

Certification

All materials are traceable to The International System of Units (Système international d'unités or SI) via the use of certified weights and certified volumetric flasks. All products are produced under the quality system meeting both ISO 9001 and ISO/IEC 17025 standards.

Gravimetric certification

Dr. Ehrenstorfer solution standards are designed for calibration or recalibration of chromatographic or other analytical systems used for quantitative or qualitative purposes. The products may also be used as reference standards for interlaboratory studies and to validate analytical procedures.

All raw materials used to prepare the multi-component mixtures are of the highest purity. After our production process, each material is checked using several of the following methods, if applicable: UV, IR spectroscopy, elemental analysis, chromatographic properties (GC/FID, GC/ECD, HPLC/DAD, TLC) and physical properties (phase, colour, odour, melting point) and Karl Fischer titration for detection of water content.

Measurement uncertainty

In accordance with the Guide to the Expression of Uncertainty in Measurement (GUM), our Certificates of Analysis list the expanded concentration uncertainty at the 95 % confidence level, using a coverage factor of k = 2. The expanded uncertainty is based on the combination of uncertainties associated with the individual steps involved in the preparation of the product e.g. purity, material density and weighing technique.

ISO Guide 34 accredited products

A range of materials are produced to ISO Guide 34 quality standards. These materials are prefixed with the code DRE-CR. This range is constantly increasing, therefore if you are unable to find the product that you require, please contact your local sales office or email us at askus@lgcstandards.com.

Additional testing for homogeneity is undertaken on ISO Guide 34 products. Three or more independent analytical techniques are generally used to characterise these materials in comparison to a single analytical technique for other products. As a result, there is more data available to calculate the Measurement Uncertainty of these products.

Expiry dates

All materials are supplied with an assigned expiry date which is printed on the certificate and the product label.

Storage and transportation

Every reference material is stored under controlled conditions as stated on the certificate. These conditions are for the long term storage of the material. Normally products are not shipped under controlled conditions as shipping times are generally < 72 hours and therefore short term. One sample of each lot is kept aside to enable checks on the specific lot to be undertaken if required.

Stability

Real time stability studies are undertaken. New compounds are not released for sale until stability data for a minimum of 3 months is available. After this time, products will be sold with a 'short shelf life' label. Stability data will be collated in real time and the expiry date of the product will be extended when this information is available. Accelerated stability studies are not undertaken on materials.

Certificates of Analysis

Dr. Ehrenstorfer Certificates of Analysis provide a full description of the material to which they relate and summarise the analysis undertaken during the characterisation process. Current Certificates of Analysis for individual lots / batches for products in the range are available on our website, www.lgcstandards.com on the relevant product pages. If you are unable to find the product that you require please contact one of our local sales offices.

An example of a Certificate of Analysis for a neat product is given below. For certificates of gravimetric solutions, the following information is included:

Gravimetric data - concentration of the product, purity and the weight of product

Solvent information – identity, lot number and exact quantity of solvent used

Traceability data – Identification of materials used including lot numbers for any neat and solution products used.

Product identification
The unique identification code for the product is given in the certificate. This code forms part of the product number (please see section on Interpreting product codes). The common names for the compound is also given.

CA
Chemical Abstracts index name.

IUPAC
A textual identifier for the chemical substances assigned by International Chemical Identifier.

Formula
Molecular formula of the material.

Mol. weight
Molecular weight of the material.

CAS No.
A unique identifier assigned by the Chemical Abstracts Service.

Certificate of Analysis

Dr. Ehrenstorfer

Expiry date
Determined by real time stability testing.

Lot number
Identification number for a specific batch of material.

Long time storage solutions. See Note 1.

Det. Purity
% purity that has been determined for this particular lot of this product.

Note 2 - Tolerance / Uncertainty
The statisical parameter used to describe the uncertainity of the purity measurement. In accordance with the Guide to the Expression of Uncertainty in Measurement (GUM), our Certificates of Analysis list the expanded concentration uncertainty at the 95 % confidence level, using a coverage factor of k = 2. The expanded uncertainty is based on the combination of uncertainties associated with the individual steps involved in the preparation of the product e.g. purity, material density and weighing technique.

Azodye metabolites

Azodyes are synthetic dyes developed for use in the textile industry. Their release into the environment can cause visual pollution and their metabolites can be harmful to the aquatic environment due to their persistence. As a result, their use is no longer permitted in many countries. This range of azodye metabolites includes individual neat compounds and solutions for both individual compounds and mixtures. Stable-isotope labelled compounds are also available.

Chloroparaffins

Chlorinated paraffins (CPs) have been produced since the 1930's and have found many applications including polymer additives, lubricants, paints, and flame retardants. The chemical stability and physical properties of the CPs made them suitable substitutes for PCBs. Because of their high distribution tendency, CPs are detected in a wide variety of environmental samples, particularly in biological material. Toxicological studies with these mixtures revealed that short chain congeners (C10-C13) show the highest activities. The use of single congeners with different levels of chlorination as reference standards is essential. LGC is in a position to exclusively offer pure single C10 congeners with defined different levels of chlorination in solutions for both individual compounds and mixtures as part of the Dr. Ehrenstorfer range*.

Diphenoquinones and dihydroxybiphenyls

4,4’-Diphenoquinones produced under oxidative conditions, such as combustion, pyrolysis and oxidative metabolism, have been detected in different environmental samples. Toxicological studies of 3,3’,5,5’-tetrachloro-4,4’-diphenoquinone showed that this substance binds to the nuclear T4 receptor like chlorinated dioxins. A range of individual compounds in solution is available*.

*Synthesized by the research group of Prof. Dr. H. Parlar (Technical University, Munich, Germany). Analytical method developed in cooperation with the research groups of Prof. Dr. M. Bahadir and Prof. Dr. H. Hopf (Technical University, Brunswick, Germany).

Dyes

Dyes that are intended for use in textiles and household products have been identified as being present in foodstuffs. For example, Sudan dyes are red dyes that have been detected in chilli powder and Malachite green has been used as a fungicide and parasiticide in the aquaculture industry. Therefore testing for these chemicals in food products is widely undertaken. This product range includes individual compounds as both neat and in solution.

Phenol and aromatic compound mixes

Phenolic and aromatic compounds can be a source of pollution as a result of degradation of industrial products such as pesticides and naturally occurring substances. A range of mixtures are available in solution. These have been designed primarily for European testing requirements. If you require a mixture of compounds that is not listed in the catalogue please contact your local sales office or visit our webshop www.lgcstandards.com and use the Custom Requests form.

Amino- and nitroaromatics/explosives

Analysis for residues of explosives as part of criminal investigations, security and testing of environmental samples is becoming increasingly widespread. Explosive compounds are inherently unstable and metabolites / breakdown products are used as markers for testing. This product range includes common explosive compounds and their breakdown products, supplied individually, as both neat and in solution, as well as mixtures of compounds in solution.

Organotin compounds

Organotin compounds are used in industry as heat stabilizers, biocides and preservatives of wood, paper and textiles. Concerns over toxicity of some organotins have led to their world-wide ban. Therefore analysis of individual compounds is required. A comprehensive range of standards is available, including the reference materials required by regulatory bodies. It includes individual compounds as both neat and in solution.

Pharmaceutical and veterinary compounds

Pharmaceuticals are widely used in managing human and animal health. Illicit use of pharmaceuticals and other compounds by the population and for economic gain in animal husbandry is also an issue. These uses of pharmaceutical compounds and their inappropriate disposal can result in residues occurring in the food chain and in the environment. The following range of compounds is commonly tested in food and / or environmental samples. It includes individual compounds as both neat and in solution.

Polychlorinated biphenyls (PCBs)

Although the production of PCBs was banned in the 1970s, due to their persistence environmental contamination, they are still an issue. A complete range of individual PCB congeners are available as neat and in solution. In addition to this, a range of standard mixtures have been designed, mainly for European Regulations e.g. Dutch 7 PCB Congeners - listed as PCB Mix 3. The PCB numbers shown below correspond to those denoted by Ballschmiter. A range of Industrial PCBs (those produced by Bayer and Monsanto) are also available in solution.

LGC offers a comprehensive range of stable isotope labelled PCB congeners, as individual congeners and mixtures in solution, in addition to native (unlabelled) standards. Please contact your local sales office or visit our webshop www.lgcstandards.com for a complete product listing and for ordering information.

Polychlorinated terphenyls (PCTs)

PCTs are similar in chemical structure to PCBs. The number of possible PCT congeners is very large; however, only a few occur in commercial chemical formulations. PCTs are virtually insoluble in water and highly resistant to degradation. A range of single chlorinated Terphenyls are available* which can be used in the analysis of technical grade mixtures such as Aroclor 2565 (mixture of PCB and polychlorinated terphenyl) and Aroclor 5432, 5442 and 5460 (as mixture of polychlorinated terphenyls).

*Developed by the research group with Prof. Alawi and Prof. Sa'adeh.

Polybrominated biphenyls (PBBs)

The principal use of PBBs were as fire retardants. They are bromine analogues of PCBs and therefore have 209 possible congeners. However, only a few occur in commercial chemical formulations.

The PBB numbers shown below correspond to those denoted by Ballschmiter. This range of products includes individual compounds as both neat and in solution. A single mixture containing all available compounds is also available.

Polycyclic aromatic hydrocarbons (PAHs)

PAHs are one of the most widespread organic pollutants. The toxicity of PAHs is dependent on their structure, with isomers having a wide range of toxicity. Hydroxy-PAHs can be monitored in human urine as an indication of exposure to pollution from industrial sources. This product range includes a range of PAHs, individually as both neat and in solution, as well as mixtures of compounds in solution.

Toxaphene single components

The insecticide Toxaphene is difficult to analyse in many matrices because of the changing percentage of the single components in the whole mixture. The research group, led by Prof. Dr. H. Parlar, has been able to characterise the most important single components. These single components are exclusively available as individual product in solution and as mixtures.

US EPA methods: standards and mixes

The United States Environmental Protection Agency 500, 600 and 8000 series test methods are approved protocols for measuring chemical pollutants in drinking water (series 500), industrial / urban effluents (series 600), ground water (series 8000) and air, soils and water taken from hazardous waste sites (CLP series). This product range includes mixtures of standards in solution, applicable to specific EPA methods within each of these series.

Pesticides: optically active enantiomers

Enantiomers of a pesticide with optical activity may exhibit selective biological effects and have different environmental fates. A range of optically active pesticides have been purified and the enantiomer content characterised. These products are available in solution.

Stable isotopes

Mass spectrometry coupled to chromatography (LC-MS/MS and GC-MS/MS) are analytical techniques that are routinely used in residue analysis. Although these techniques provide excellent selectivity and sensitivity, they can be subject to matrix enhancement / suppression effects, which impact on the accuracy of any quantitative measurement. A range of isotopically labelled compounds including pesticides and veterinary compounds are available individually, as both neats and in solution.

LGC offers a comprehensive range of stable isotope labelled standards. Please contact your local sales office or visit our webshop www.lgcstandards.com for a complete product listing and for ordering information.

Pesticide mixes

In addition to a wide range of individual pesticide and pesticide metabolites offered neat and in solution, a range of multiple compounds in solution have been developed, together with our customers. These mixes are generally focused on European testing requirements.

LGC also offers a Custom Solution Service. If you require a mixture of compounds that is not listed in the catalogue please contact your local sales office or visit our webshop **www.lgcstandards.com** and use the Custom Requests Form.

Matrix reference materials – How LGC can meet your needs

LGC produces world leading ISO Guide 34 accredited Certified Reference Materials (CRMs) and quality control materials (QCs) for all major scientific industries. Together with our network of leading international partners we deliver matrix reference materials for many applications including:

Environmental

- soils, sand & sediments
- potable & non potable waters
- plant matter
- industrial waste products

For the analysis of:

- organic - pesticides, PAHs, PCBs, hydrocarbons
- inorganic - heavy metals, minerals, arsenic & mercury speciation

Food

- meat, fish, animal feed and vegetable matter
- cereals and grains
- milk and dairy products
- food and drink products

For the analysis of:

- contaminants – pesticides, veterinary residues, toxins and metals
- constituents – proximates, nutritional elements, vitamins and alcohol content
- allergens, authenticity, meat speciation and Genetically modified organism (GMO)

Bringing together materials produced in our own laboratories and products from the world's other leading producers; LGC is your single source for food and environmental matrix reference materials – developing new products to support the scientific community in response to food and environmental concerns.

Alphabetical listing of individual standards

Metals standards for the pharmaceutical industry

Regulatory requirements for inorganic impurities are being tightened. Be prepared and get your reference standards for metals from LGC Standards.

The changes finally made official in the USP-NF General Chapters <232> “Elemental Impurities – Limits” and <233> “Elemental Impurities – Procedures” highlight a valid concern that the analytical techniques in place are inadequate for the analysis of inorganic impurities in drug substances and products in the modern world.

The former tests in General Chapter <231> are based on an unspecific sulfide precipitation and will be replaced by instrumental analytical methods like ICP-OES and ICP-MS. Limits will be given not only for the single metals, but will also take into account the different species of certain elements.

LGC Standards provides the perfect range for your metals residues analysis, and will facilitate greater analytical certainty. All products are prepared from high purity raw materials, acids and 18 Mohm Di water, assayed by NIST HP-ICP-AES method, and purity is confirmed by ICP-MS. Furthermore, they are manufactured under ISO 9001 and ISO Guide 34, certified under ISO/IEC 17025 and accompanied by a NISTtraceable COA. LGC Standards can also provide you with single element standards for your specific needs.

Inorganic standards

VHG originated as a commercial testing laboratory in the early 1980s, moving into the production and sale of inorganic standards with aqueous standards in 1984, petroleum standards in 1987 and instrumentation consumables in 1991.

The range includes products for applications using Atomic Absorption Spectroscopy (AA), inductively coupled plasma optical emission spectrometry (ICP-OES), Inductively coupled plasma mass spectrometry (ICP-MS) and Ion Chromatography (IC).

In addition to the Aqueous Standards presented in this section, VHG also offer an extensive range of Petroleum Standards and Solid Standards. For a complete listing of the product range please contact your local sales office or visit the website www.lgcstandards.com.

Single-element standards for ICP

A complete range of single element standards is available. VHG A* Standards are ideal for all elemental techniques including ICP and ICP-MS. They are prepared from high purity raw materials in our ISO Guide 34 facility and certified in our ISO/IEC 17025 laboratory usi ng ICP-MS. All VHG A* standards are

- assayed using NIST HP-ICP-AES method
- accompanied by NIST-traceable COA
- packaged in acid-leached, triple-rinsed HDPE bottles
- shipped in poly-sealed bags
- certified for 18 months shelf life

Glass ampoules are ideal for storing volatile standards, but once opened they are no longer suitable for storage. The alternative use of screw cap bottles can result in evaporation through the thread. There is also a risk of contamination from the cap. The CERTAN® bottle is a sample container with a capillary-opening.

It has been specifically developed for use with organic reference solutions. Using the CERTAN® bottle makes the concerns of storing volatile solutions a thing of the past. The bottles are available in the following sizes: 1.5 mL, 4.5 mL and 10 mL.

Advantages of CERTAN®

- Minimal change in concentration, even when open
- Completely secure, free of losses
- Lower contamination risk
- Aliquots easily removed using a standard GC syringe
- Proven usability from -30°C to +50°C
- Almost impossible to spill

Applications for CERTAN®

- Supply of standard solutions
- Long term storage for solutions from ampoules
- Storage of stock solutions
- Archiving of production samples
- Holding challenging samples, such as BTEX aromatics
- Transport and storage of ring-test samples
